

QuickFix

One-Tap Service Booking with Instant Acceptance

Android App Project Proposal

A Revolutionary Platform Connecting Customers with Local Service Providers

1. The Problem Statement

Current Reality in India:

- Need a plumber? You call one, he quotes Rs.500, you have no idea if it's fair
- You search on UrbanClap/JustDial - fixed prices, often inflated
- You ask neighbors - random recommendations, no accountability
- Skilled workers struggle to find customers, customers struggle to find fair prices

The Broken Cycle

Customer: "I have no bargaining power, I don't know fair rates"

Worker: "I have no steady work, middlemen take huge cuts"

Platforms: "We charge 25-40% commission from workers"

Why Existing Apps Fail

App	Problem
Urban Company	You book, they assign - no choice, fixed price
JustDial	You get numbers, call each one - manual and tedious
Housejoy (Dead)	Took 30%+ commission - workers left

2. The Solution: QuickFix

QuickFix is an "Uber for Services" platform where customers can book local service providers (plumbers, electricians, AC repair, etc.) with just 3 taps. Workers receive instant notifications and the first to accept gets the job.

How It Works

STEP 1: Customer opens app and sees service categories

STEP 2: Taps "Electrician" > Selects "Fan not working" > Picks time

STEP 3: Instant notification sent to all electricians within 3-5 km

STEP 4: First worker to ACCEPT gets the job (like Ola/Uber)

STEP 5: Customer sees worker details with live tracking

Why QuickFix is Different

Feature	QuickFix	Others
Booking Speed	30 seconds	10-15 minutes
Commission	5-8%	25-40%
Price Control	Worker decides	Platform fixed
Transparency	Full	Low

3. User Flow

Customer Journey (3 Taps to Book)

Screen 1 - Home: Shows service categories (Electrician, Plumber, AC Repair, Carpenter, Cleaning)

Screen 2 - Select Service: Shows sub-services (Fan repair, Switchboard, Wiring issue, New fitting)

Screen 3 - Confirm: Shows location, time selection (Now/Schedule), and "Find Worker" button

Screen 4 - Worker Found: Shows worker name, rating, distance, ETA, and live tracking

Worker Journey (1 Tap to Accept)

Push Notification: "New Job Alert! Fan repair - Indiranagar - 1.2 km - Rs.300-400"

Options: [ACCEPT] or [DECLINE]

After Accept: Shows job details, customer contact, and navigation option

4. Smart Features

Feature	Description
Dynamic Radius	No workers in 3km? Auto-expand to 5km, then 7km
Surge Indicator	Shows high demand areas, workers may charge more
Acceptance Score	Workers who accept more get priority notifications
Smart Pricing	App suggests price range based on area + demand
Worker Queue	If first worker cancels, auto-notifies next nearest
Favorite Workers	Book trusted workers again with direct request
Group Booking	Book plumber + electrician together
Live Tracking	Track worker location in real-time on map

5. Business Model

Revenue Streams

Stream	Description	Type
Commission	5-8% per completed job	Primary
Priority Notify	Workers pay Rs.5 to get notified first	High margin
Subscription	Rs.299/month = 0% commission for workers	Recurring
Express Fee	Rs.49 for 30-min arrival guarantee	Premium
Trust Badge	Rs.499 for verified + background check	One-time
Service AMC	Annual maintenance contracts	Recurring

Unit Economics

Average job value: Rs.500

Commission (5%): Rs.25

Jobs per day (1 city): 500

Daily revenue: Rs.12,500

Monthly (1 city): Rs.3.75 Lakhs

Scale to 10 cities = Rs.37.5 Lakhs/month

6. Technical Architecture

Tech Stack

Component	Technology	Purpose
Mobile App	Kotlin / Java	Android native development
Database	Firebase Firestore	Real-time data sync
Notifications	Firebase Cloud Messaging	Instant push to workers
Backend Logic	Cloud Functions	Geo-query, job matching
Maps	Google Maps API	Location, tracking, ETA
Payments	Razorpay	In-app payments, payouts
Auth	Firebase Auth	Phone OTP authentication

First Accept Algorithm

1. Get customer location (latitude, longitude)
2. Query workers where: service_type matches, is_online is true, distance <= 3km
3. Sort by: Distance (nearest first), Rating (higher first), Premium subscribers
4. Send FCM push to top 10 workers simultaneously
5. First worker to tap Accept: Lock job using Firestore transaction
6. If no accept in 60 seconds: Expand radius to 5km, notify next batch

7. MVP Scope for College Project

Must Have Features

Feature	Description
Service Selection	Customer app - select service, request
Job Notifications	Worker app - receive notification, accept/decline
Real-time Status	Firebase real-time job status updates
Location	Google Maps - show worker location
Ratings	Basic rating system after job completion
Push Notifications	FCM for instant alerts

Nice to Have Features

- Payment integration with Razorpay
- Live tracking on map
- In-app chat between customer and worker
- Price history analytics
- Worker earnings dashboard

8. Growth Strategy

Phased Rollout

Phase	Scope	Timeline
Phase 1	One city, one service (Electricians in Bangalore)	3 months
Phase 2	5 services (Plumber, AC, Carpenter, Painter, Cleaning)	6 months
Phase 3	5 major cities	12 months
Phase 4	Tier 2 cities + specialized services	18 months

Competitive Advantage

Factor	QuickFix	Competitors
Commission	5%	25-40%
Price Control	Worker decides	Platform fixed
Transparency	Full	Low
Booking Speed	30 seconds	10+ minutes

9. Why This Project Stands Out

For College Evaluation

- Novel Concept: First "Uber for Services" with instant acceptance in India
- Real Business Potential: Clear revenue model with proven unit economics
- Solves Both Sides: Helps workers AND customers simultaneously
- Scalable: Works for any service category, any city
- Technical Depth: Real-time systems, geofencing, push notifications
- Social Impact: Empowers blue-collar workers, removes middlemen

Technical Skills Demonstrated

- Android Development (Kotlin/Java)
- Firebase (Firestore, Cloud Functions, FCM, Auth)
- Google Maps API Integration
- Real-time Data Synchronization
- Push Notification Systems
- Payment Gateway Integration
- Algorithm Design (First-Accept Matching)

Summary

QuickFix solves a real, everyday problem faced by millions of Indians - finding reliable, fairly-priced local services quickly. By combining the simplicity of ride-hailing apps with the local services market, QuickFix creates value for both customers (convenience, transparency) and workers (more jobs, fair commission).

This project demonstrates strong technical implementation, viable business thinking, and meaningful social impact - making it an ideal college project that could potentially become a real startup.
